

Session VI_a: Service Creation

Chair: Joe Sventek, *Hewlett-Packard*

Rapid Service Development on a TINA-Based Service Deployment Platform

Jack Verhoosel
Martin Wibbels
John-Luc Bakker
Harold Batteram

Outline

- ❖ Introduction
- ❖ MESH platform overview
- ❖ Rapid Service development
- ❖ Conclusion
- ❖ Future work

Lucent Technologies
Bell Laboratories

MESH objectives

- ❖ To accelerate the introduction of advanced telematics services for the ESH.
- ❖ To study and explore new telematics services and possibilities.
- ❖ To design, implement and validate a service platform for the ESH.

Lucent Technologies
for telemedicine

Application domains

- ❖ Tele-consultation in the health sector.
- ❖ Teamwork between university lectures.
- ❖ Tele-learning for students.
- ❖ Tele-meeting in a distributed organization.

Lucent Technologies
for telemedicine

MESH partners

- ❖ Lucent Technologies
- ❖ SURFnet
- ❖ KPN Research
- ❖ Telematics Institute
- ❖ Centre for Telematics and Information Technology (CTIT)

(<http://www.mesh.nl/extern/english.htm>)

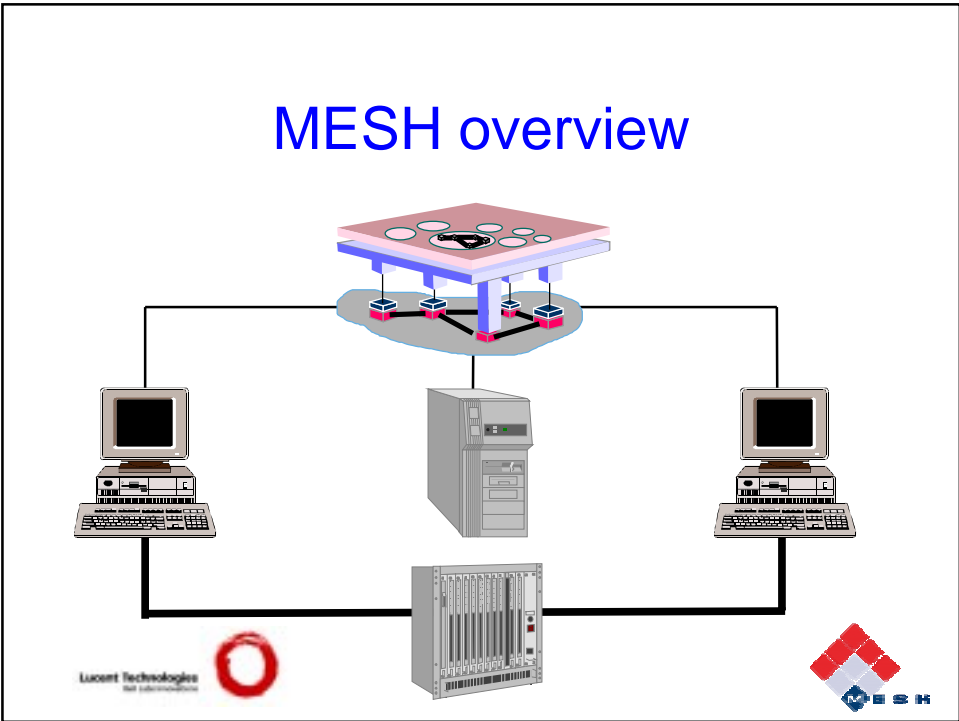

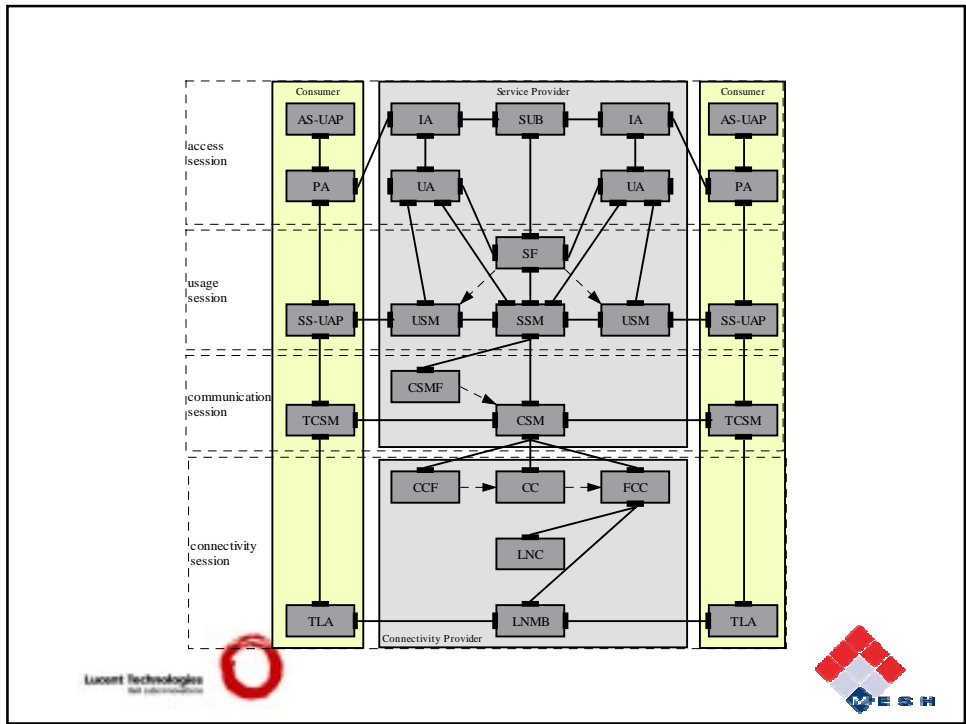

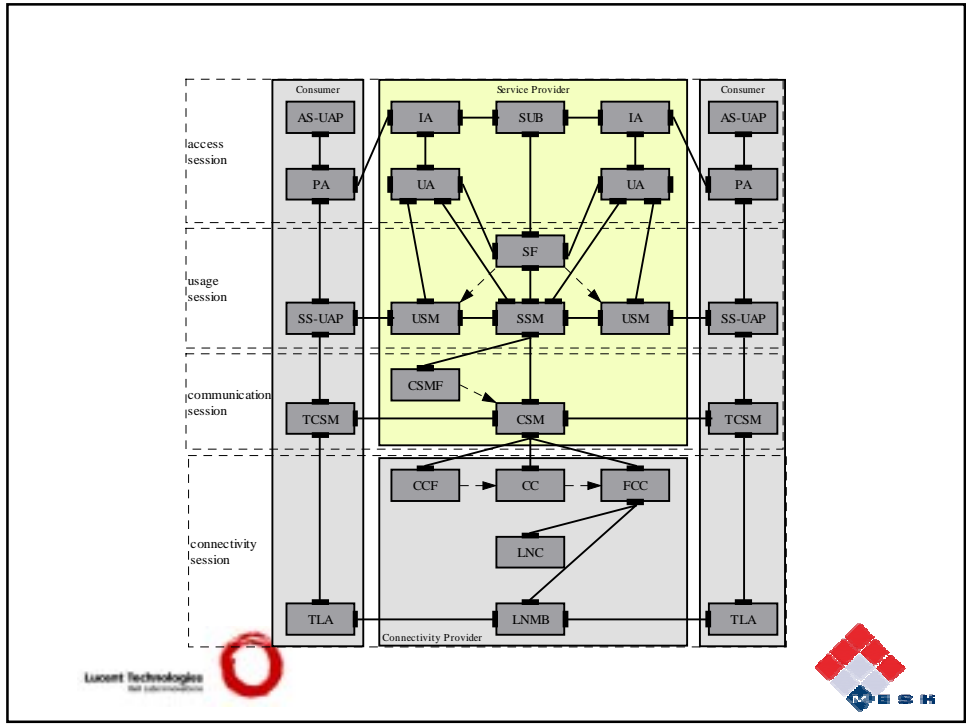

MESH users

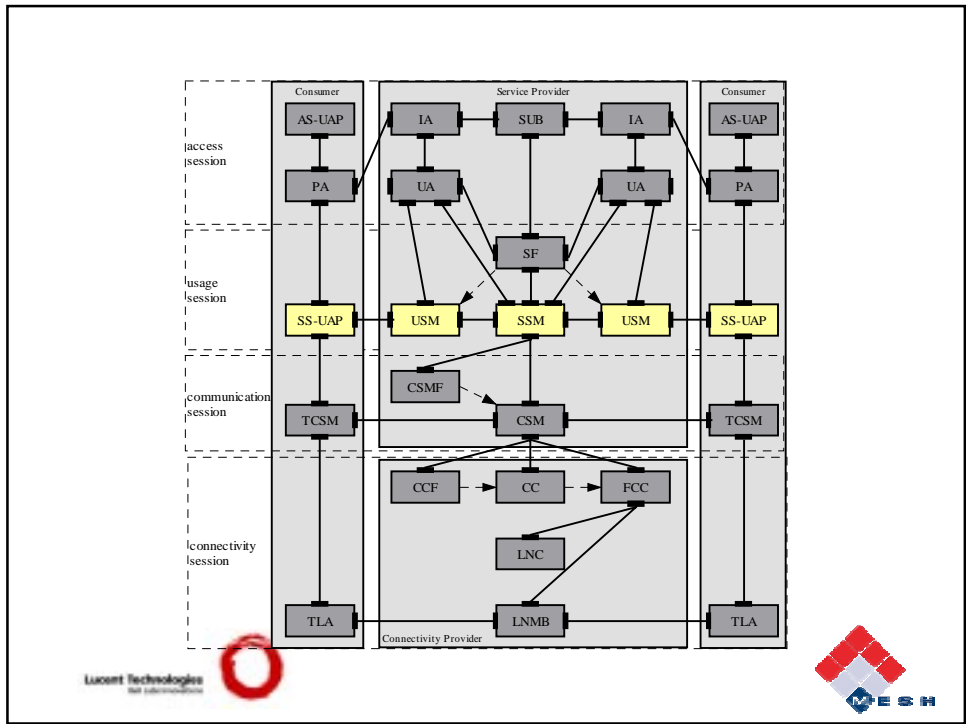

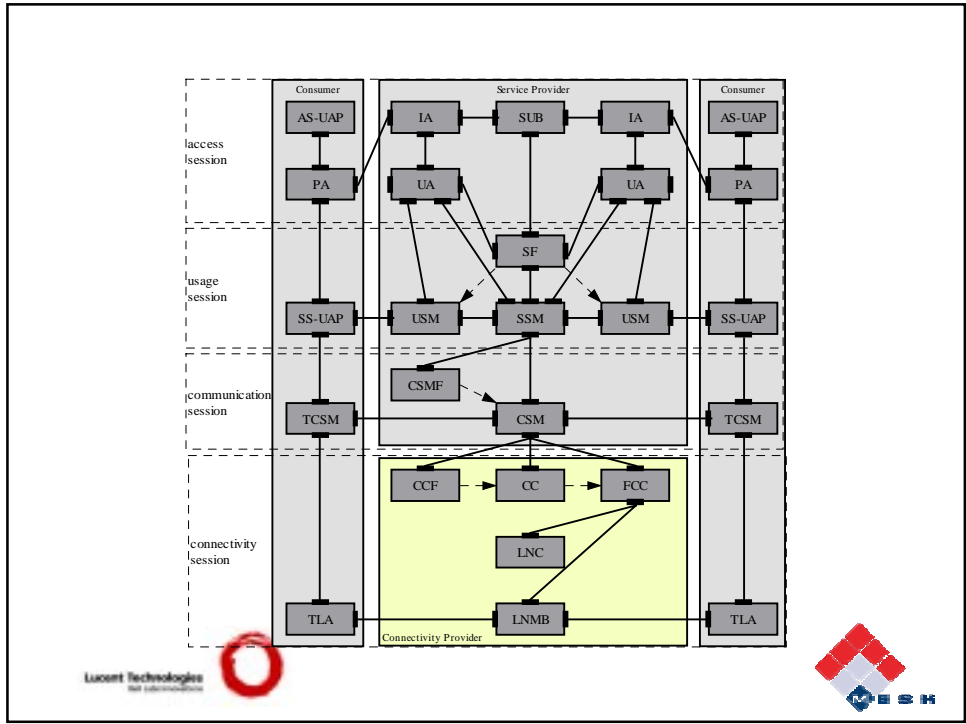

- ❖ Academic Hospital University Amsterdam
- ❖ Roessingh Research and Development
- ❖ Delft University of Technology
- ❖ University of Twente

MESH overview

Distributed Software Component Framework

- ❖ Encapsulates distr. programming logic
- ❖ High level software building blocks
- ❖ Interaction through IDL-interfaces

Lucent Technologies
THE INNOVATION SOURCE

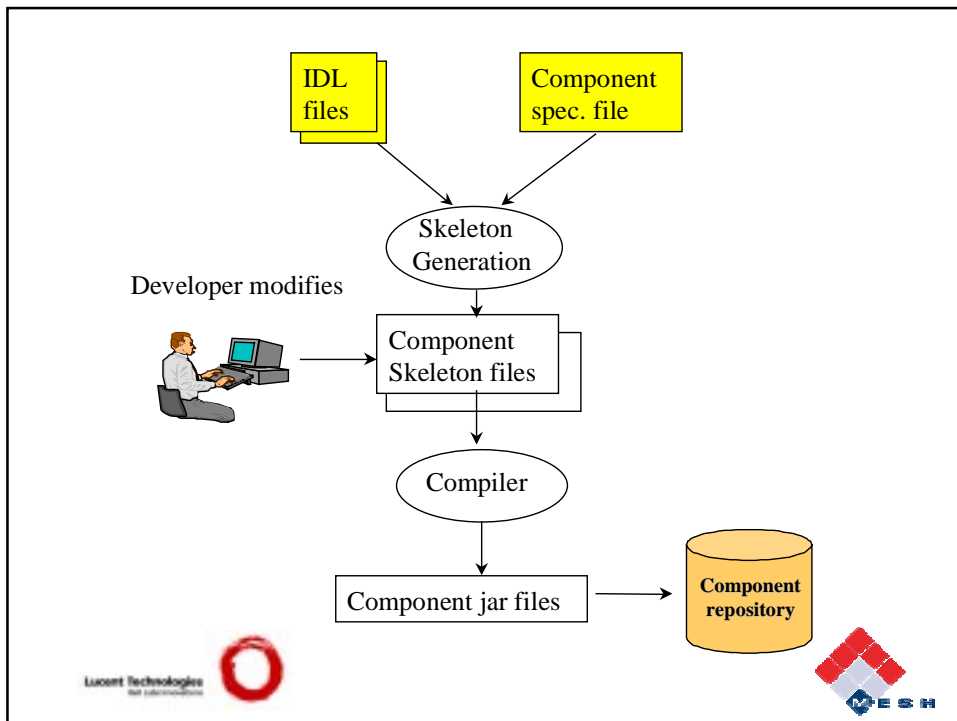

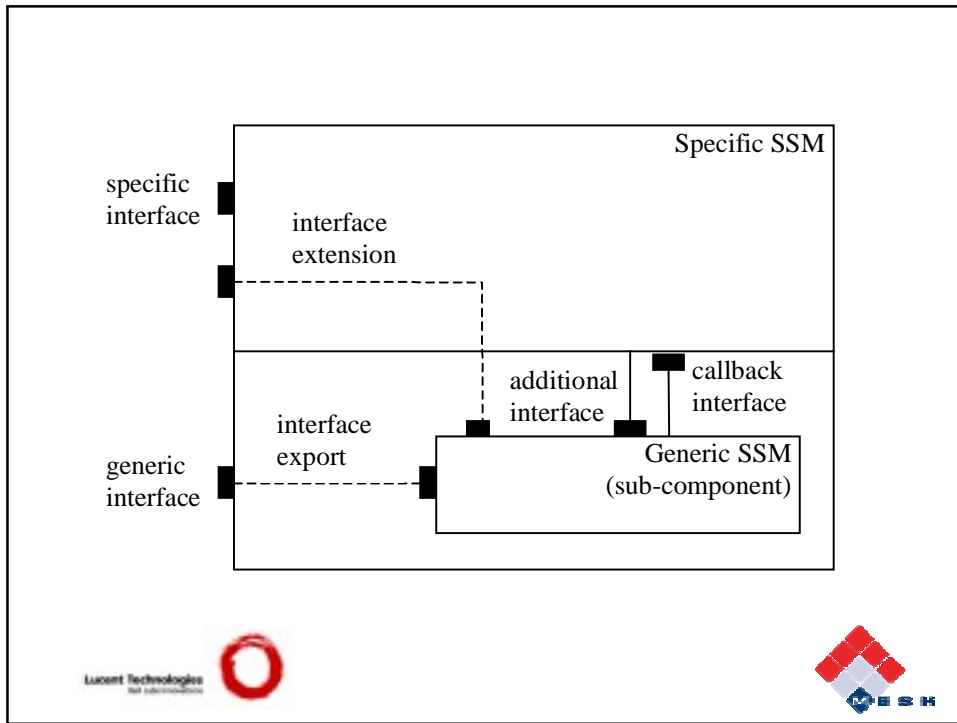

Compound component

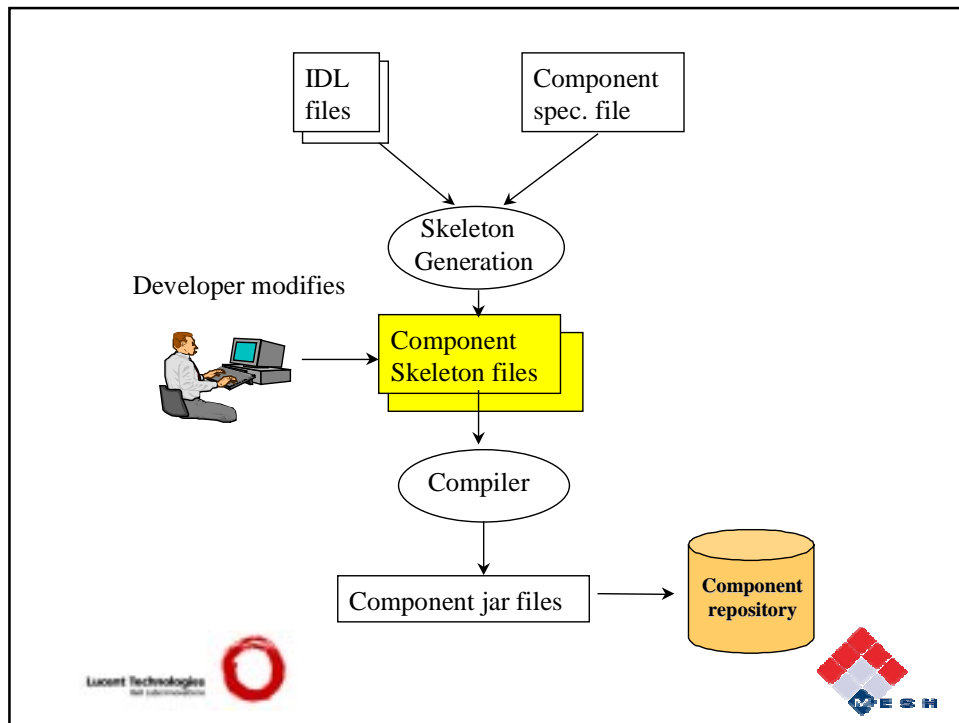

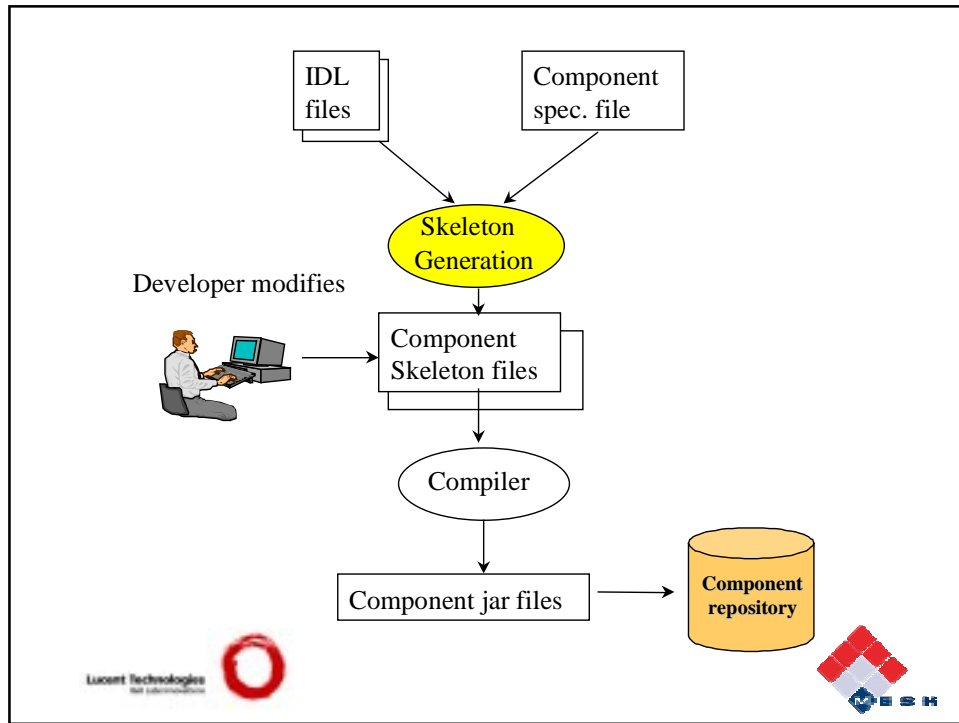

- ❖ Specialization through aggregation
- ❖ Dynamic composition
- ❖ Selective export of interfaces

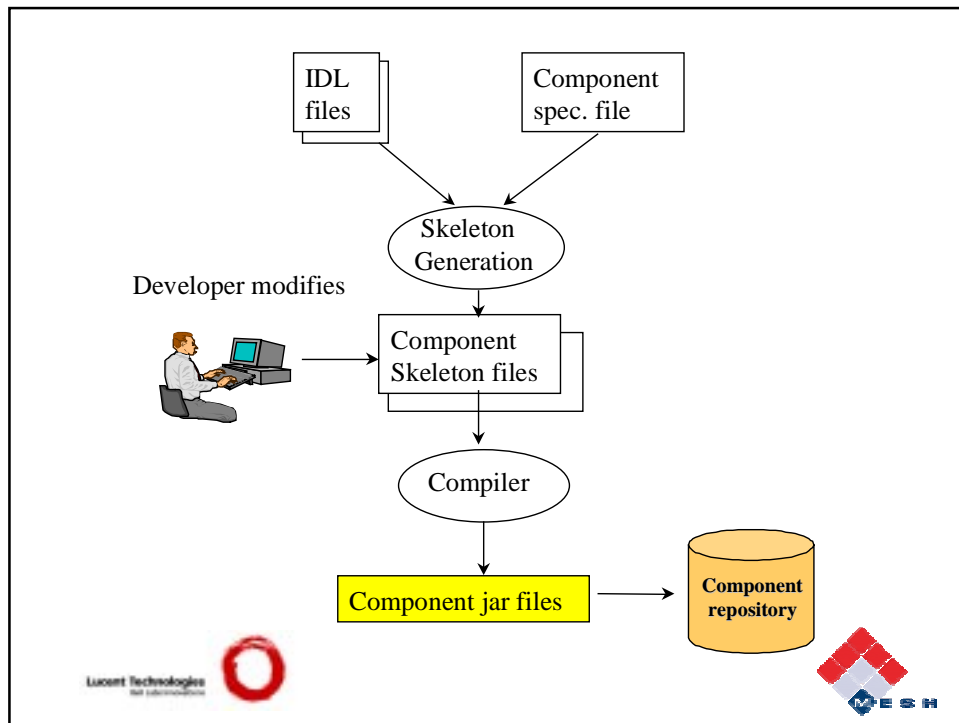

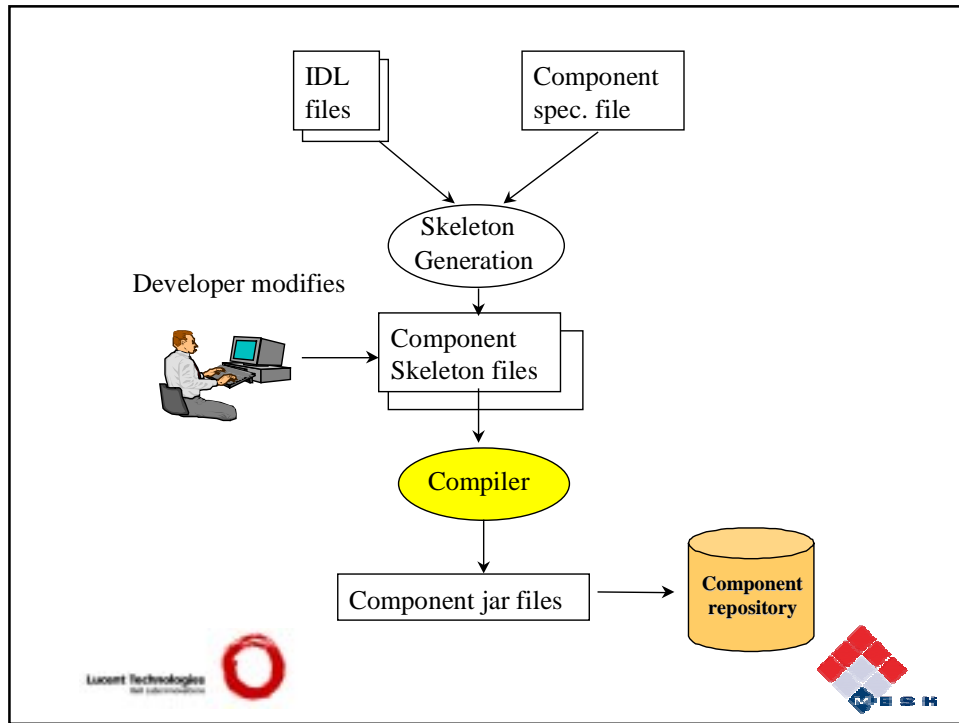

Lucent Technologies
THE INNOVATION SOURCE

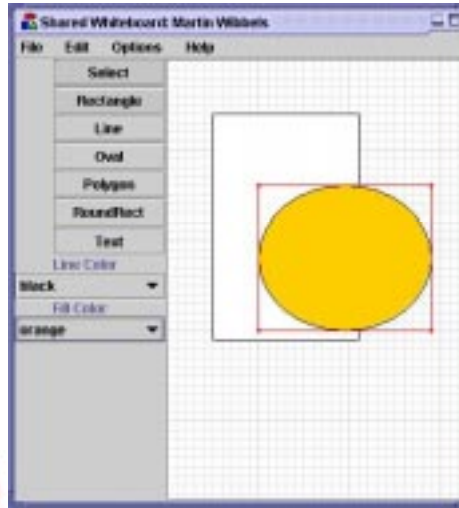

Shared Whiteboard

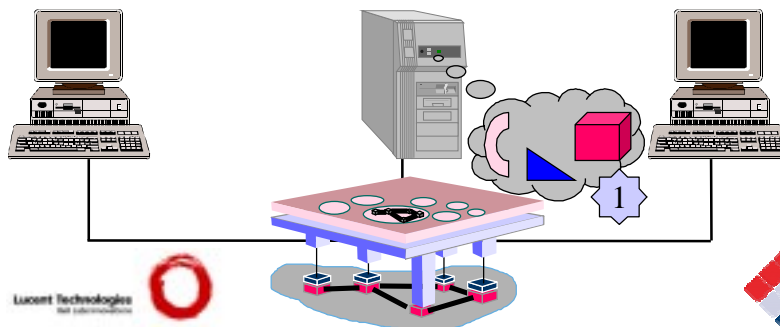

Lucent Technologies
800 441-7000

Shared white board service

- ❖ Service provider maintains white board state

Lucent Technologies
800 441-7000

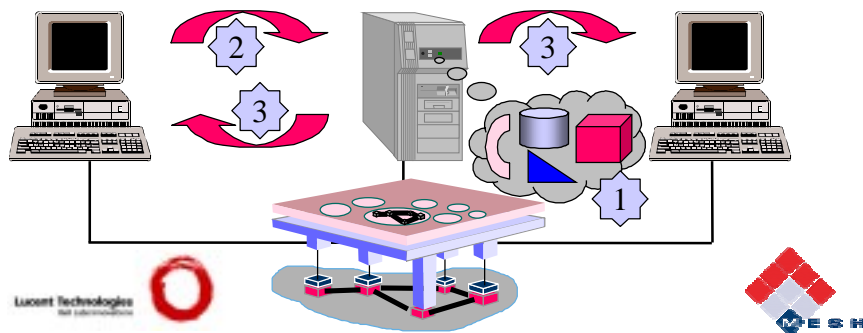

Shared white board service

- ❖ Service provider maintains white board state
- ❖ Change state of white board

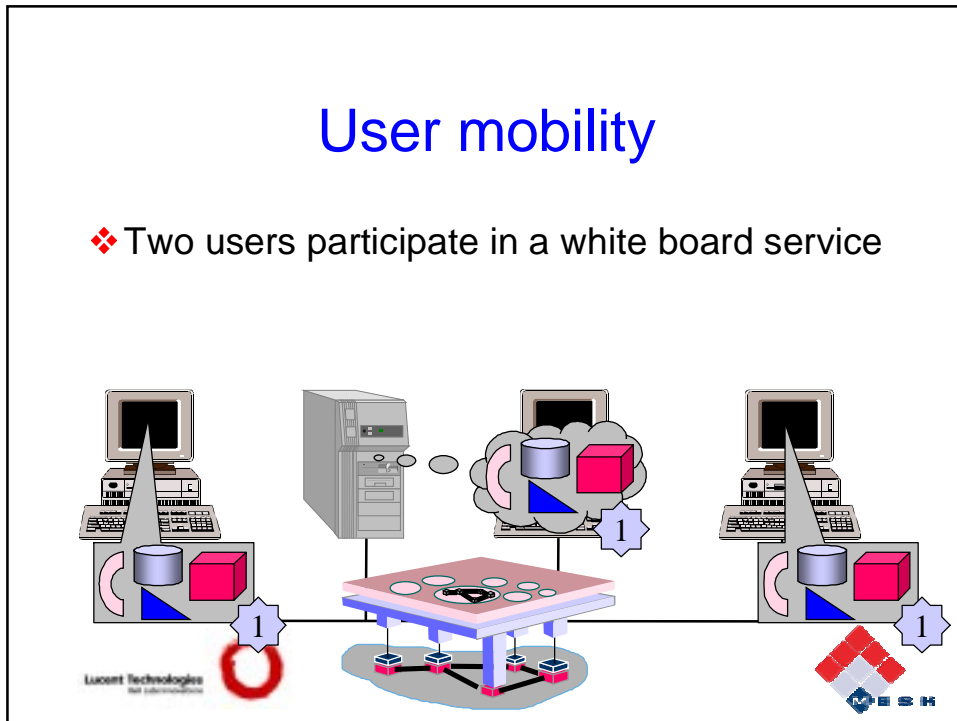

Shared white board service

- ❖ Service provider maintains white board state
- ❖ Change state of white board
- ❖ Distribute new state

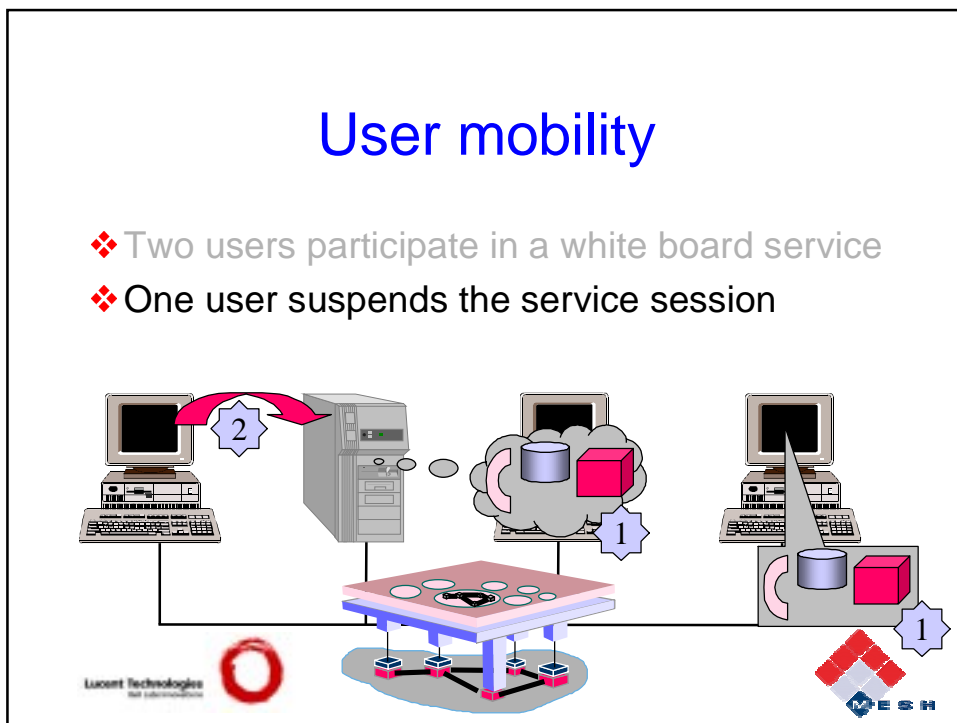

User mobility

- ❖ Two users participate in a white board service

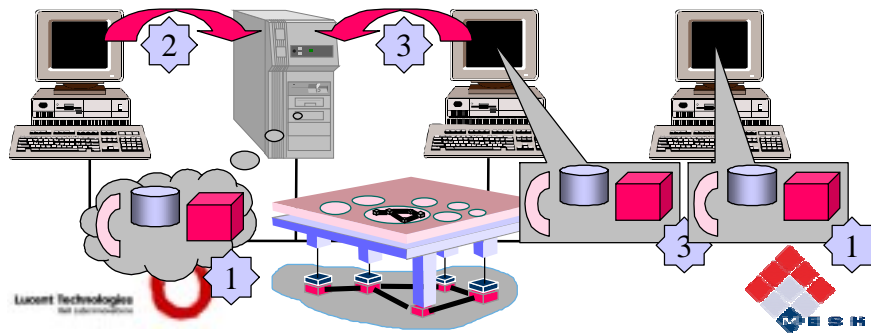

User mobility

- ❖ Two users participate in a white board service
- ❖ One user suspends the service session

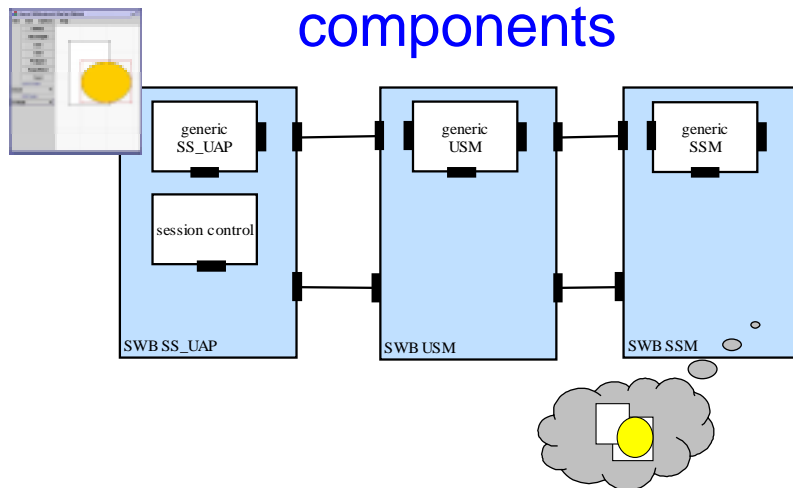

User mobility

- ❖ Two users participate in a white board service
- ❖ One user suspends the service session
- ❖ The session is resumed from another terminal

Shared Whiteboard components

Subscription Service

The screenshot shows a configuration window titled "Subscription Service: Martin Wibbeke". It contains several input fields: "First Name" (Martin), "Middle Name(s)", "Last Name" (Wibbeke), "New Access Password", and "Reset Access Password". Below these are two list boxes: "Available Services" containing "Video (1)" and "Activated Services" containing "Shared Whiteboard (3)", "Mesh Service (4)", "Subscription Service (5)", "Swt (7)", and "Database (8)". Navigation buttons include ">", "<", ">>", "<<", "Prev", and "Next".

Shared Database

The screenshot shows a "Query List" window with a table of requirements. The table has columns for Title, Status, In release, and Priority. The requirements listed are:

Title	Status	In release	Priority
Use Winsock2's atm adapters	Analysis	R2	normal
Local	Closed		High
Agency tool	Analysis	R1	high
Telescope	Analysis	R1	high
High quality audio if a system is used by several peo...	Closed	R1	high
Link between platform and backend	Closed	R1	normal
Architecture of files and objects	Analysis	R1	high

Conferencing Service

Conclusion

- ❖ TINA provides a solid architecture with many generic features for multi party, multi media services.
- ❖ Interfaces to extend SS-UAP, USM and SSM should also be standardized.
- ❖ The combination of TINA and the DSC framework allow rapid service development.

Future work

- ❖ New project FRIENDS.
- ❖ Focus on service creation and deployment at a larger scale.
- ❖ Based on the TINA and MESH experiences.

Framework and Paradigm based Process for TINA Service Creation *and* Engineering of Interworking TINA-based Telecommunications Services

Dr Richard Sinnott

GMD Fokus

Berlin, Germany

Mario Kolberg

University of Strathclyde

Glasgow, Scotland

Overview of Presentation

Brief introduction to TOSCA

- what we want to do and who we are

Service creation in TOSCA

- paradigms and frameworks
- TOSCA Process Model Outline

Description of SDL based Service Engineering

- outline of Service Federation

Demo

TOSCA Intentions

Develop tools/techniques for service creation

- should speed up service creation
- should widen service creation audience
- should not be detrimental to service quality

Propose approach based on paradigm tools, OO frameworks and validation techniques

- includes validation of isolated and deployed services, i.e. potentially interworking (later!)

The TOSCA Consortium

Service Creation in TOSCA

Approach based on Paradigm tools

- Movies, Functional Block, (more later!)

OO Frameworks

- capture design experience that can be used to create a broad class of similar(?) services
- have specific places (holes) where specific service behaviour can be inserted

Paradigm based Service Creation

Allows for service complexity to be hidden

- user of paradigm tool need not know specifics of framework, e.g. whether in C++/CORBA, SDL, ...
- output of tool is specialising code or specification fragments that complete service, i.e. fill in the holes!

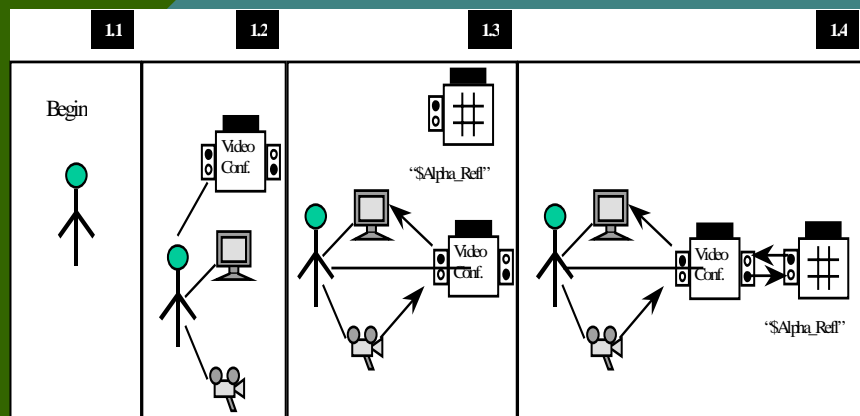

TOSCA Paradigm Tools

Functional block paradigm user constructs service through combination of graphical building blocks (more later!)

Movies paradigm user constructs service through sequence of snapshots that highlight expected service behaviour - *ala* a movie sequence

Typical Movie Sequence

Object-Oriented Frameworks

Capture generic and re-useable design that can be applied to create class of services

- includes semantics!!!

Have predefined holes where service creators can add/refine behaviour

TOSCA built frameworks around service session

- start, stop, suspend, resume user/service sessions

Developing OO Frameworks

TOSCA has developed OO Frameworks in

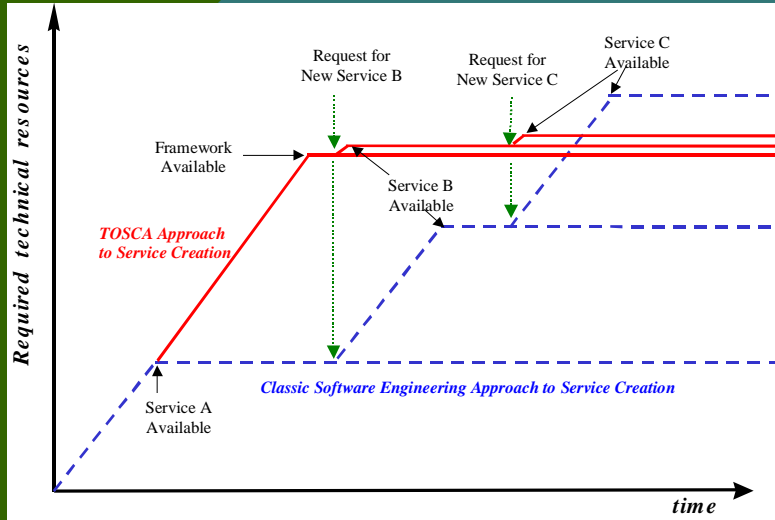

- C++/CORBA
- SDL

Starting point is ODL/IDL description

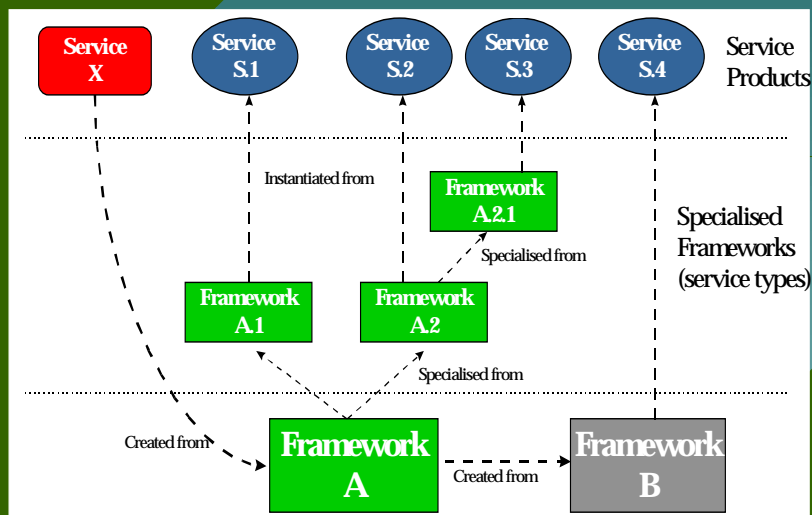

More later on framework development,
relation between different frameworks
and services derived from frameworks!!!

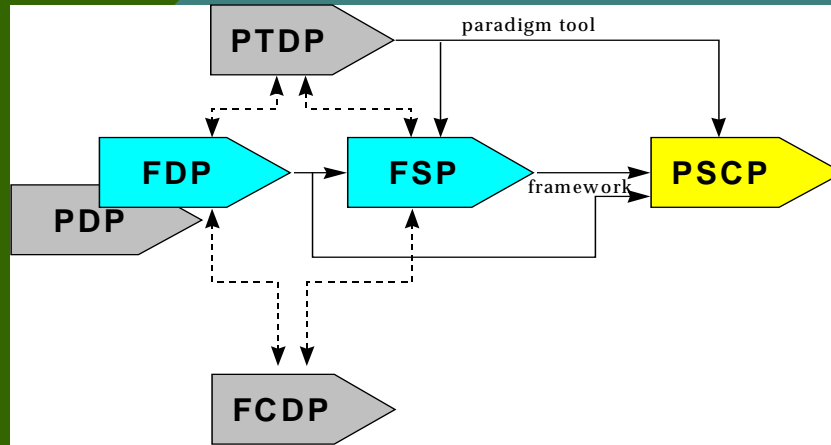

Framework based Service Creation

Framework based Service Creation

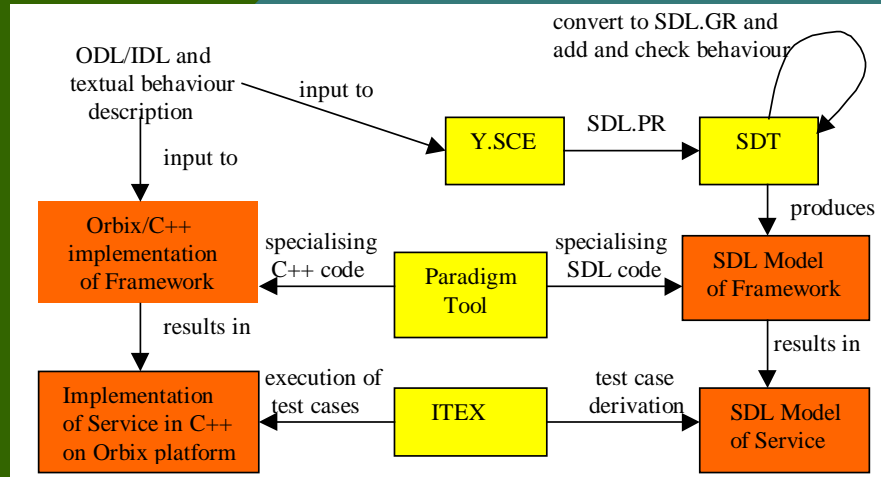

TOSCA Process Model

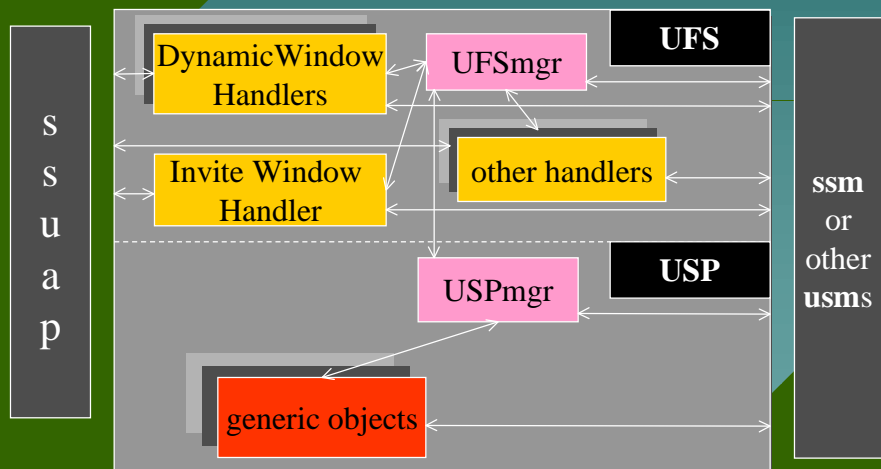

Over to Mario!

The TOSCA Tool Chain

Outline of USM Structure

IDL for USM manager

```
interface i_UFSmgr : i_CO_lifecycle
{
    void suspendSessionRequest();
    void terminateSessionRequest();
    void requestObject(inout NamedObject obj);
    oneway void ufsstart();
    oneway void ufsstop();
    oneway void ufssuspend();
    oneway void ufsresume();
};
```

ODL to SDL mapping

ODL Structure	SDL Mapping
Group type	Block type
Object type	Block type
Interface type	Process type
Object Reference	Pid
Oneway (asynchronous) Operation	Signal prefixed with pCALL_
Operation (synchronous)	Signal pair. The first signal is prefixed with pCALL_, the second signal prefixed with pREPLY_ or pRAISE_ (if exception raised)
Exception	Signal prefixed with pRAISE_
Basic IDL types, e.g. long, char, float,...	Syntype
Enum	Newtype with corresponding literals
Typedef	Syntype
Struct	Newtype with corresponding structure
Constant	Synonym

Example of the mapping

Package Name_Interface

```

signal pCALL_i_UFSmgr_suspendSessionRequest;
signal pCALL_i_UFSmgr_terminateSessionRequest;
signal pCALL_i_UFSmgr_ufsstart;
signal pCALL_i_UFSmgr_requestObject(NamedObject);
// and associated pREPLY_ signals – but not for ufsstart (oneway)
signallist i_UFSmgr_INVOCATIONS =
    pCALL_i_UFSmgr_suspendSessionRequest,
    pCALL_i_UFSmgr_terminateSessionRequest,
    pCALL_i_UFSmgr_ufsstart, pCALL_i_UFSmgr_requestObject...;
signallist i_UFSmgr_TERMINATIONS =
    pREPLY_i_UFSmgr_suspendSessionRequest,
    pREPLY_i_UFSmgr_terminateSessionRequest,
    pREPLY_i_UFSmgr_requestObject... ;
    
```

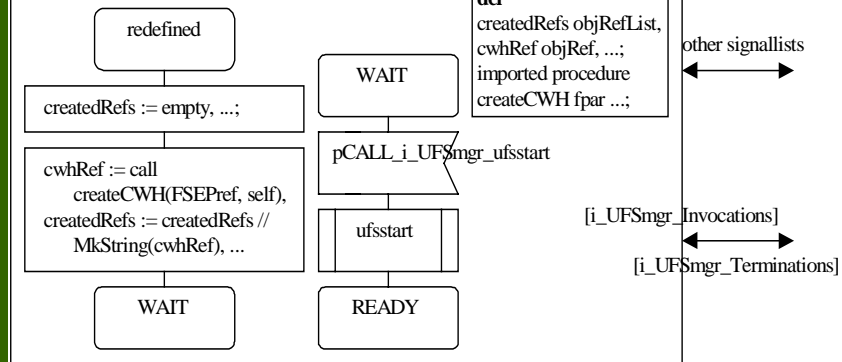

SDL framework

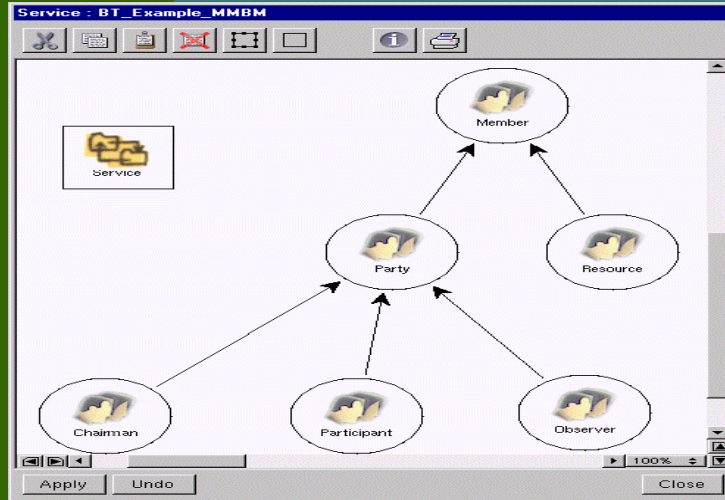

virtual process type theUFSmgrImp;

inherits <<package Name_Definition/block type USM/block type UFS>> i_UFSmgr

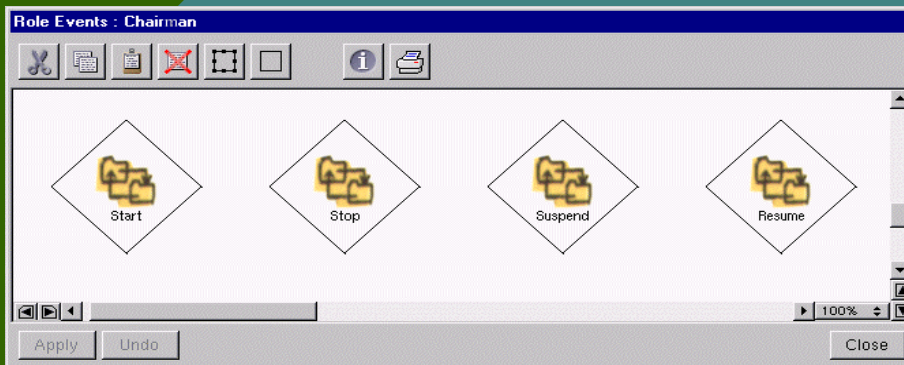

fpar in FSEPref objRef, ...;

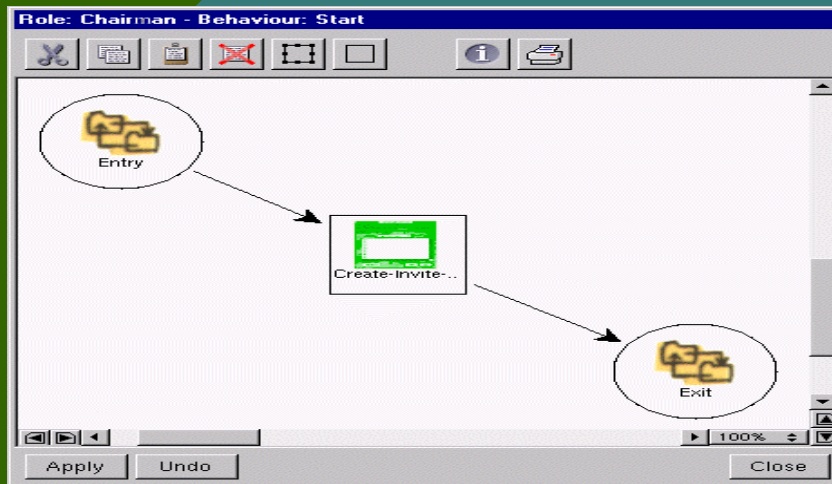

Functional Block Paradigm Usage

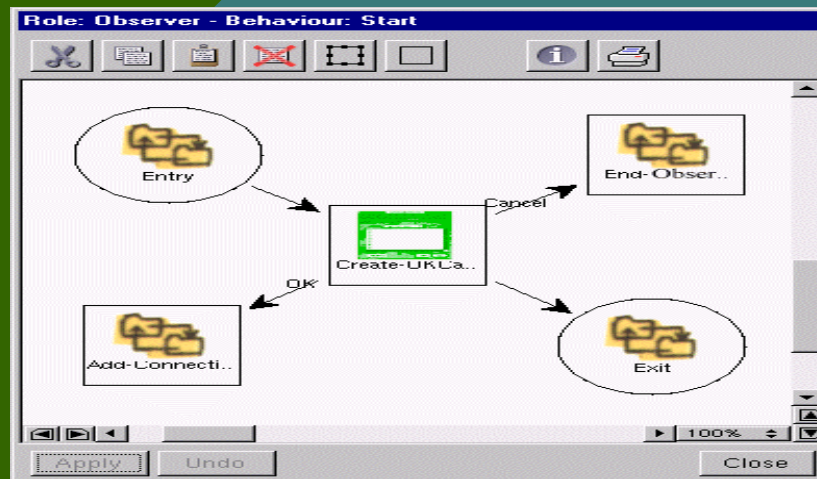

Functional Block Paradigm Usage contd...

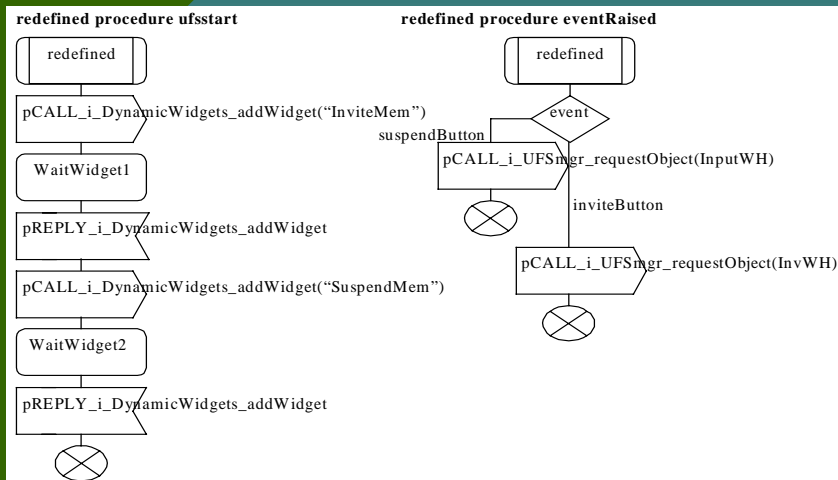

Functional Block Paradigm Usage contd...

Functional Block Paradigm Usage contd...

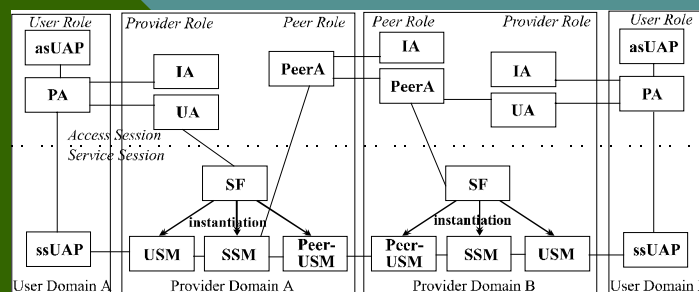

Example of Specialising SDL

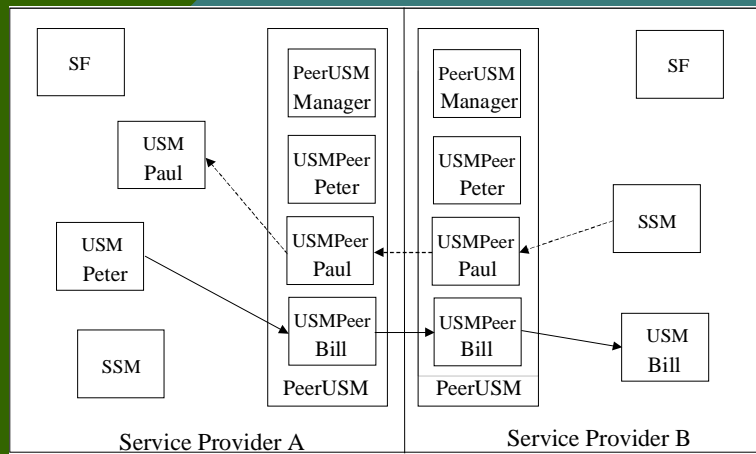

Federation

- domain federation
 - provides environment for two or more providers to transparently offer service across their domains by setting up access session
 - is basis for and governs:
- service federation
 - establishes service session across two or more retailer domains

Basic Design of PeerUSMs

Experienced Interactions

Issue related to federation of same services:

- clash between the role specified in the invitation and the role assigned to the initial user (Board-Meeting, Videophone Service)

Issues related to federation of slightly different services:

- role cardinality
- implemented policies like:
'When chairman goes, the session goes.'

Conclusions

Frameworks allow semantics to be captured
AND re-used

Paradigm tools allow for rapid service
creation

- no need to know framework specialisation details
- no need to know programming or specification languages or distributed environments to create services

Conclusions contd

SDL models of services allow for

- animation (look and feel of the services)
- more detailed exploration of service behaviour
- test case generation and execution against service

Service interworking causes service interactions

- federation contract: when are two services compatible?
